Besides creating indexes via `CREATE INDEX`, you can also add an index to a table right when creating that table - like this:

```
CREATE TABLE <table_name> (
    ... column definitions,
    INDEX <index_name> (<column>)
);
```

Please note that this is **supported when using MySQL** but it **won't work with Postgresql**.

You should always dive into the documentation of the database system you're using, to learn which features / syntax is available!

If you want to get rid of an index, you can also always do that via `DROP INDEX <index_name>`.
